

Compiled vs Interpreted Languages -2

- **Compiled Language:** The code is translated into machine code before execution. This usually makes execution faster
- **Interpreted Language:** The code is executed by an interpreter at runtime, without being fully compiled into machine code beforehand
- **C#:** C# is **compiled** into **Intermediate Language (IL)** first. Then, the **.NET Runtime (CLR)** uses **JIT (Just-In-Time) compilation** to convert IL into machine code during execution

Difference Between Implicit, Explicit, Convert, and Parse Casting -3

Description	Type
Conversion happens automatically when there is no significant risk of losing data	Implicit
The programmer manually specifies the conversion when data loss or incompatibility may occur	Explicit
Uses the Convert class to convert between different data types, including strings and numeric types	Convert
Converts a string into a specific data type. It throws an exception if the string is not in a valid format	Parse
